

Track 2: Boundless Agents

This handbook is intended for participating teams that have registered or plan to register for the GOAI Boundless Agents track, helping contestants understand the track directions, participation paths, submission requirements for each stage, technical requirements, evaluation criteria, and Q&A channels.

01 Track Overview

1.1 Basic Track Information

Track Name	Track 2: Boundless Agents
Track Positioning	AI Agent application innovation for real-world industry scenarios
One-line Introduction	Focus on high-frequency scenarios such as personal devices, automotive and mobility, financial services, education, and industrial manufacturing, exploring agent applications that are runnable, demonstrable, and replicable.
Keywords	Industry Agents, closed-loop tasks, product experience, multi-turn interaction, tool calling, knowledge bases, multimodality, data compliance
Track Co-creators	ModelScope, Ant Group, etc.

1.2 Track Introduction

The [Boundless Agents] track focuses on real-world deployment of AI Agents in industry scenarios. It encourages teams to build agent applications for high-frequency scenarios across personal devices, automotive and mobility, financial services, education, and industrial manufacturing, with capabilities including task understanding, workflow orchestration, tool invocation, knowledge enrichment, multi-turn interaction, and result delivery. Multimodal entries are especially welcome.

This track does not encourage generic chatbots, single-point Q&A tools, or simple content generators. Instead, entries should target real users, real business workflows,

and real closed-loop tasks, validating how AI Agents can enter industry environments, improve efficiency and experience, and form application prototypes with sustained usage value.

Entries can be built on technical capabilities such as large models, agent frameworks, industry knowledge bases, tool calling, multimodal interaction, and workflow

orchestration. Unless otherwise specified by specific topics, there are, in principle, no mandatory restrictions on development frameworks, models, or tool platforms.

1.3 Core Work Requirements

Entries should complete at least one demonstrable and verifiable closed-loop task, and clearly explain target users, scenario pain points, interaction flow, technical approach, data sources, compliance boundaries, and future iteration plans.

- Address one of the five industry topics, or propose a refined scenario based on real needs that aligns with the track positioning;
- Avoid generic Q&A, content generation, or concept-only demos without user workflows;
- Provide a runnable demo, video demonstration, or equivalent verifiable material;
- Explain the models used, agent architecture, tool interfaces, knowledge bases, data processing, and deployment approach;
- Clearly state data authorization, privacy protection, risk warnings, and industry boundaries;
- Open, reusable application templates, tool components, sample data, or technical documentation are encouraged.

1.4 Target Participants and Best-fit Teams

This track is open to global developers, startup teams, university students, research teams, enterprise technical teams, product teams, and open-source community members. Participating teams may consist of individuals or multiple members, and interdisciplinary and cross-major teaming is highly encouraged.

- AI engineers, front-end and back-end developers, product managers, designers, and industry experts;
- University students and researchers, open-source project contributors, and startup team members;
- Teams familiar with industry scenarios such as glasses, automotive, finance, education, and industrial manufacturing;
- Teams capable of completing interaction design, data preparation, tool calling, and result validation around real user needs;
- Experience in product presentation, roadshows, technical documentation, and open-source collaboration is preferred.

02 Award Settings. This track features awards and special incentives specific to the track. All prize amounts are before tax.

Award	Quantity	Description
GOAI Grand Prize	1 winner	RMB 1 M
Track Champion	1 winner	RMB 500K
Track Runner-up	1 winner	RMB 300K
Award	Quantity	Description
Track Third Place	1 winner	RMB 100K
Open Source Rising Star Award	4th-10th place, 7 teams	Gifts worth RMB 5,000 per team
Open Source Impact Award	11th-15th place, 5 teams	Gifts worth RMB 3,000 per team
Excellence Award	Semi-finalist teams	Commemorative gift package worth RMB 500 per team
Participation Award	Teams submitting valid entries	Competition commemorative T-shirts

03 Competition Stages Overview

Stage	Time	Key Milestones & Results	Key Deliverables
Registration Opens	Jul 16	Registration launched	Registration information
Preliminary	Jul 16 –	Aug 16 Preliminary submission	Project introduction, proposal PPT / PDF,

	Aug 16	deadline	optional prototype or video
Preliminary Review	Aug 17 – Aug 24	Aug 24 Announcement of semi-finalists (Top 30 teams advance to semi-finals)	No new submissions unless requested by the Organizing Committee
Semi-final	Aug 25 – Sep 3	Sep 3 Semi-final submission deadline	Updated proposal, Demo, running instructions, code or equivalent engineering materials
Semi-final Review	Sep 4 – Sep 10	Sep 10 Announcement of finalists (Top 15 teams advance to the finals, invited to the offline final defense to compete for the final awards)	No new submissions unless requested by the Organizing Committee
Final	Sep 22	Offline final defense and presentation	Final roadshow PPT, on-site Demo, project one-pager, defense materials
GOAI DAY / Award Ceremony	Sep 23	Award presentation, project showcases, and ecosystem matchmaking	Final roadshow PPT, on-site Demo

*The schedule may be adjusted flexibly based on actual progress, subject to the Organizing Committee's final notice.

04 Registration Phase: Registration, Teaming, and Topic Directions

4.1 Registration Method

Contestants shall register through the official website. Participating teams need to submit:

- Registrant's Name
- Country/Region
- Mobile Number
- Frequently Used Email Address
- Team Name
- Total Team Size
- Team members, identity, and contact information

- Intended track and intended industry topic

4.2 Teaming Rules

- Contestants can participate individually; for team participation, the maximum team size is 3 members.
- Team member information cannot be modified once the preliminary entry is submitted.
- For teams advancing to the semi-final stage, the Organizing Committee will verify the real-name identity of all team members. The Organizing Committee reserves the right to disqualify any team members or teams from subsequent rounds and awards if they fail to complete verification as required or provide false real-name details.

4.3 Topic Directions (Five Industry Topics)

Participating teams can select from the following five industry topics, or propose a more refined application scenario based on real user needs. The following directions are intended to help understand the track's positioning and do not limit the specific creative boundaries of the entries.

Topic	One-line Positioning	Focus
AI + Glasses	Native agents for next-generation personal intelligent terminals	First-person perspective, voice interaction, real-time perception, always-available companionship, and lightweight feedback
AI + Automotive	Intelligent vehicle agents for the full owner lifecycle Agent	Closed-loop vehicle purchase, usage, maintenance, after-sales service, travel, and in-cabin experience
Topic	One-line Positioning	Focus
AI + Finance	Financial-service agents for business operations and risk analysis Agent	Document understanding, rule matching, risk alerts, investment research aggregation, and workflow assistance
AI + Education	Education agents for personalized learning and teaching assistance Agent	Personalized learning, homework support, learning diagnosis, teacher lesson preparation, and learning companionship
AI + Industrial Manufacturing	Industrial agents for equipment operations and supply-chain collaboration Agent	Equipment, quality, work orders, inventory, production scheduling, and supply-chain coordination

4.3.1 AI + Glasses | Native agents for next-generation personal intelligent terminals

- Travel Assistant Agent: Route reminders, environmental alerts, language translation, real-time Q&A, and itinerary assistance.
- Learning Companion Agent: Knowledge explanation, key point recording, terminology lookup, study planning, and review reminders.
- Productivity Agent: Teleprompting, meeting minutes, on-site inspection, summary generation, to-do organization, and information retrieval.
- Sports & Health Agent: Exercise reminders, motion feedback, rhythm advice, and safety alerts.
- Lifestyle & Consumption Agent: Personalized suggestions and instant assistance in shopping, dining, socializing, traveling, and daily reminders.

Boundary Requirements: Entries should highlight the device characteristics of AI glasses, avoiding the simple replication of mobile apps, web applications, or generic AI chat tools. If Rokid glasses are used, the Agent Demo can be recorded using the Fused Screen Recording function.

4.3.2 AI + Automotive | Intelligent vehicle agents for the full owner lifecycle Agent

- Intelligent Car Purchase Consultant Agent: Vehicle model recommendations, configuration comparisons, purchase plan generation, and test-drive booking guidance.
- Owner Vehicle Assistant Agent: Vehicle functions, maintenance cycles, energy consumption analysis, fault alerts, and insurance services.
- Long-Distance Travel Planner Agent: Route, weather, charging / refueling, rest stops, companion needs, and luggage arrangement.
- Intelligent Cabin Companion Agent: Providing content and services based on driving scenarios, passenger roles, time status, and user preferences.
- After-Sales Service Agent: Problem description, preliminary troubleshooting, maintenance booking, progress inquiries, and after-sales feedback collection.

Boundary Requirements: This topic does not require entries to be directly connected to real vehicle control systems, and does not encourage operations involving high-risk driving control, autonomous driving decisions, or actions affecting vehicle safety.

4.3.3 AI + Finance | Financial-service agents for business operations and risk analysis

- SME Business Profiling Agent: Generating business profiles, risk alerts, and service recommendations.

- Credit Material Pre-examination Agent: Identifying missing items in loan documents, formatting issues, and key risk points.
- Investment Research Information Organizer Agent: Summarizing, comparing, and tracking announcements, financial reports, news, research reports, and industry data.
- Insurance Claim Assistant Agent: Explaining claim procedures, checking for missing documents, and generating checklists and reminders.
- Financial Compliance Q&A Agent: Querying business boundaries and compliance notes based on policy documents or simulated rule bases.

Boundary Requirements: This topic emphasizes financial assistance scenarios and does not directly encourage providing definitive investment advice, credit approval conclusions, insurance payout decisions, or other content that replaces professional institutional decision-making.

4.3.4 AI + Education | Education agents for personalized learning and teaching assistance Agent

- Personalized Learning Planner Agent: Generating staged learning plans and dynamically adjusting learning paths based on student goals, knowledge foundation, practice performance, and study time.
- Homework Support Agent: Providing step-by-step prompts, error cause analysis, knowledge point review, and similar question practice for subjects such as mathematics, English, programming, and science, rather than directly giving answers.
- Learning Diagnosis Agent: Identifying student knowledge weak points and generating learning diagnostic reports and improvement suggestions based on practice records, test results, classroom performance, or simulated data.
- Teacher Lesson Preparation Agent: Assisting teachers in generating course outlines, classroom activities, case materials, blackboard writing structures, after-school exercises, and layered teaching plans.
- Reading and Language Learning Agent: Providing vocabulary explanations, grammatical feedback, expression optimization, and learning records for scenarios such as reading comprehension, foreign language learning, oral practice, and writing revision.
- Vocational Education / Programming Education Agent: Providing task decomposition, process guidance, feedback evaluation, and

learning path suggestions for scenarios such as job skills, project training, coding practice, and interview preparation.

Boundary Requirements: Entries should demonstrate the ability to teach students based on their aptitude, avoiding simple Q&A from question banks, standard answer generators, or generic chatbot tools. If student data, homework data, assessment data, or learning records are involved, they must use public data, simulated data, or authorized, anonymized data. They must not replace the final educational evaluation of teachers, schools, or professional institutions.

4.3.5 AI + Industrial Manufacturing | Industrial agents for equipment operations and supply-chain collaboration Agent

- Equipment Fault Diagnosis Agent: Assisting in determining fault causes based on sensor data, alarm logs, maintenance manuals, and historical work orders.
- Quality Anomaly Analysis Agent: Correlating quality inspection data, batch information, process parameters, and production records to locate sources of anomalies.
- Work Order Dispatching Agent: Generating dispatch recommendations based on problem types, personnel skills, spare parts inventory, urgency, and production line status.
- Supply Chain Risk Warning Agent: Alerting risks based on orders, inventory, supplier lead times, logistics status, and demand variations.
- Production Planning Assistant Agent: Generating scheduling recommendations by combining capacity, materials, equipment status, personnel shifts, and delivery requirements.

Boundary Requirements: If safe production, equipment control, or on-site operational recommendations are involved, it must be explicitly stated that the output is for auxiliary reference only and does not replace professional judgment or corporate safety regulations.

05 Preliminary Round: Proposal Design and Material Submission

5.1 Preliminary Goals

The preliminary round focuses on evaluating the project direction, scenario value, product solution, technical approach, open/reusable value, and feasibility. Submission of runnable code is not mandatory, but providing prototypes, screenshots, videos, or sample data for auxiliary explanation is encouraged.

5.2 Preliminary Submission Materials

Submitted Material	Mandatory	Format Requirements	Content Description
Project Introduction	Yes	Text description (within 500 words)	Project name, selected industry topic, target users, core problem, solution, innovation points, open/reusable value, and current progress.
Proposal PPT	Yes	PPT / PDF	Explaining the scenario origin, user pain points, core workflow, product form, Agent capabilities, usage of tools/data/models, compliance boundaries, and subsequent implementation plans.
Demo Video or Prototype	Optional	Video / Link / Screenshot	If a prototype is already available, it can showcase key interaction workflows, sample inputs and outputs, and expected effects.
Runnable Code Package	Optional	Repository link / Zip archive	If submitted, it should include the entry point, dependency description, configuration files, sample inputs/outputs, and evidence of operation.

5.3 After Passing the Preliminary Round

Teams advancing to the semi-final round will enter the semi-final stage in accordance with the Organizing Committee's notice. They will receive relevant materials, Q&A sessions, mentor guidance, or resource support, as per the competition arrangements. The specific number of advancing teams, the distribution methods for resources, and optimization suggestions will be further communicated by the Organizing Committee via email or community channels.

06 Semi-final Round: Demo Implementation and Application

Validation

6.1 Semi-final Goals

The semi-final round focuses on evaluating project completeness, Demo runnability, user workflow closed-loop, technical implementation, data and compliance explanations, evaluation results, and open/reusable standards.

6.2 Semi-final Submission Materials

Submitted Material	Mandatory	Format Requirements	Content Description
Updated Project Proposal	Yes	PPT / PDF	Updating the target scenario, product workflows, Agent architecture, data sources, tool calling, risk boundaries, evaluation metrics, and implementation plans based on preliminary feedback.
Runnable Demo / Demo Video	Yes	Online experience / Local deployment / Video presentation	Showcasing at least one complete task chain, including user input, Agent processing, tool or knowledge base calling, result delivery, exception handling, and effectiveness validation.
Code Repository or Equivalent Engineering Materials	Yes	Repository link / Zip archive	Containing the entry point, dependency description, configuration files, sample data, deployment instructions, testing methods, and evidence of operation.
Data Sources and Compliance Statement	Yes	Document	Specifying data types, sources, authorization status, anonymization methods, privacy protection, industry risk warnings, and the boundary of not replacing professional decisions.

6.3 After Passing the Semi-final Round

Teams advancing to the final round will be invited to participate in the offline final defense, performing on-site roadshows, Demo presentations, and expert Q&A sessions. The final-round shortlist, defense arrangements, on-site testing requirements, and presentation guidelines will be published on the official website by the Organizing Committee and notified via email/community channels.

07 Final Round: On-site Roadshow and Project Presentation

7.1 Final Goals

The final round will focus on evaluating project presentation effects, on-site defense capabilities, product experience, technical completeness, open/reusable value, implementation potential, and long-term growth.

7.2 Final Round Submission Materials

Submitted Material	Mandatory	Format Requirements	Content Description
Final Roadshow PPT	Yes	PPT / PDF	Forming a complete narrative around scenario value, product workflows, Agent capabilities, technical architecture, Demo results, evaluation metrics, safety & compliance, and open/reusable plans.
On-site Demo	Yes	On-site demonstration / Online experience / Local deployment	Showcasing the complete task closed-loop, key interactions, sample inputs/outputs, error handling, and technical highlights.
Final Version of Code Repository or Equivalent Materials	Yes	Reviewer-accessible repository / Delivery package	Providing the final accessible version, including README, deployment instructions, open-source license, sample configurations, testing methods, and necessary account details.
Industry / Scientific Research Matchmaking Needs	Optional	Form	If there are needs for commercialization, scientific research cooperation, venture capital, or open-source community matchmaking, they can be filled out in accordance with the Organizing Committee's requirements.

7.3 Track Common Submission Materials

Unless otherwise specified by specific topics, all participating teams shall, in principle, submit the following materials. The specific submission formats, material templates, open platforms, resource support, submission frequency, and deadlines shall be subject to official notices from the Organizing Committee or announcements on the official website.

Material	Content Suggestions
Video Demo	Showcasing the core functions, typical usage workflows, key interactions, and final effects of the entry, helping judges quickly understand what problem the work solves, how it runs, and how results are generated.
Material	Content Suggestions
Project Introduction Document	Including project name, team information, selected topic, target users, scenario pain points, core functions, Agent design concepts, technical route, innovation points, and

	application value.
Instructions for Use	Including running environment, deployment methods, account permissions, operation workflows, input samples, output explanations, and precautions.
Technical Architecture Description	Including model selection, Agent architecture, tool calling methods, knowledge base or retrieval-augmented generation (RAG) design, multi-turn dialogue and context management, workflow orchestration, data processing flows, and system architecture diagrams.
Data Sources and Compliance Statement	Including data types, data sources, authorization methods, whether data is anonymized, whether it contains personal or sensitive information, data usage boundaries, compliance risks, and mitigation measures.
Runnable or Verifiable Materials	Providing code repositories, online access addresses, installation packages, container images, API documents, demo accounts, operation screenshots, logs, or other verifiable materials as required by the competition.

08 General and Technical Requirements for Entries

This chapter outlines general technical requirements across all stages. The preliminary round can focus on design concepts. In contrast, the semi-final and final rounds must progressively deliver runnable, verifiable engineering materials.

8.1 General Requirements for Entries

1. **Oriented to Real Scenarios:** Entries should center on specific users, tasks, and industry workflows, and must clearly explain who the target users are, what problems need to be solved, and why an Agent is required to solve them.
2. **Equipped with Agent Capabilities:** Entries should reflect the Agent's capabilities in task understanding, multi-turn interaction, task decomposition, tool calling, knowledge enhancement, context management, workflow orchestration, or result delivery. Submitting only general chatbots, single-turn Q&A tools, prompt demos, or simple content generators is not recommended.
3. **Form a Closed-Loop Task:** Entries should complete at least one entire task chain, such as from user consultation to solution generation, from document input to pre-examination feedback, from learning diagnosis to path planning, from anomaly detection to work order recommendations, or from travel demands to route planning and reminders.

4. **Demonstrable:** Entries must be verifiable via video demos, online systems, runnable environments, code repositories, simulated data, or equivalent materials. Upon entering the semi-final/final round, contestants must provide reviewer-accessible engineering materials, Demos, evidence of operation, or equivalent verifiable materials as requested by the Organizing Committee.
5. **Clear Data Sources:** The data, documents, knowledge bases, interfaces, models, or third-party platforms used in the entries should clarify their sources, authorization methods, processing methods, and usage boundaries. When using simulated data, the simulation logic and scope of application should be explained; when using real data, necessary authorization, anonymization, and compliance processing must be completed.
6. **Clear Boundary Expressions:** When involving scenarios such as finance, education, industry, automotive, and personal terminals, the entries should clearly explain usage boundaries, risk warnings, and human-in-the-loop confirmation mechanisms. Auxiliary system outputs must not replace the final judgment of professional institutions, corporate personnel, teachers, financial institutions, competent authorities, or safety officers.

8.2 Requirements for Agent Application Closed-Loop

1. **Task Input:** The system receives task inputs from users, industry data, documents, sensors, business forms, or external systems.
2. **Intent Understanding:** The Agent identifies user goals, key constraints, context information, and risk boundaries.
3. **Task Planning:** Decomposing user goals into executable steps and clarifying whether tools, knowledge bases, human-in-the-loop confirmation, or external systems are required.
4. **Capability Invocation:** Invoking models, knowledge bases, APIs, databases, business systems, or multimodal capabilities to complete key steps based on project needs.
5. **Result Delivery:** Outputting understandable, actionable, and traceable results to users, including descriptions, checklists, suggestions, reports, or next actions.
6. **Validation and Feedback:** Proving result effectiveness through evaluation metrics, sample data, user confirmation, logs, screenshots, or videos.
7. **Safety Boundaries:** Clearly limiting and prompting high-risk industry judgments, sensitive data, real-world control actions, and professional decisions.

8.3 Product Experience Requirements

- Clear target users and explicit interaction entries, allowing users to easily understand how to start, progress, and complete tasks;
- Demos should showcase real workflows, rather than merely presenting single-turn Q&A or static pages;
- Output content should be structured, readable, and capable of explaining its basis, sources, or processing logic;
- Clear prompts for failures, missing information, uncertain results, and nodes requiring human confirmation;
- The use of natural product forms across the Web, mobile, smart hardware, chat interfaces, enterprise tools, and industry systems is encouraged.

8.4 Data, Knowledge Base, and Context Enhancement Requirements

- If public data, simulated data, industry documents, or self-built knowledge bases are used, their sources, update frequency, authorization status, and applicability boundaries should be explained;
- If knowledge bases or retrieval-augmented generation are used, the construction of the knowledge base, retrieval strategies, citation sources, update mechanisms, and error handling must be explained;
- If user inputs, business data, or sensitive information are used, their anonymization, minimized use, access controls, and deletion mechanisms must be explained;
- If long-term dialogues or multi-step tasks are involved, how the Agent manages context, memory, states, and historical information should also be specified.

8.5 Tool Calling and External System Specifications

Entries may connect to APIs, plugins, SDKs, databases, business systems, hardware devices, or third-party platforms, depending on the application scenario. Project materials should clarify the invocation methods for external capabilities, the scope of authority, result handling, failure handling, and user-perceivable risk boundaries.

8.6 Optional Technical Capability Specifications

Technical Direction	Capability Examples	Description
Agent Application Framework	Self-selected Agent framework/workflow framework	Specifying framework selection, task planning, tool calling, and state management methods.

Tool and Platform Integration	APIs / SDKs / plugins / business systems / hardware devices	Specifying invocation methods, scopes of authority, return result handling, and failure handling.
Knowledge Enhancement	Industry knowledge bases/document retrieval/database queries	Specifying data sources, retrieval strategies, source citations, and update mechanisms.
Multimodal Capabilities	Voice, images, videos, sensors, etc.	Scenarios such as glasses, automotive, and industrial manufacturing can highlight the value of multimodal interaction.
Runtime Verification	Screenshots, videos, logs, evaluation metrics, and user feedback	Used to prove that the Demo is runnable, results are verifiable, and problems can be reviewed.

09 Open Source, Compliance, and Safety Requirements

GOAI encourages participating teams to compete in an open, shared, and co-constructed manner, and encourages entries to produce reusable achievements in code, documents, tool components, sample data, application templates, runtime reports, etc. At the same time, entries must meet the requirements of data compliance, intellectual property rights, industry boundaries, and safety risk warnings.

Item	Requirement Description
Open-Source Code Requirement	Submission of code is not mandatory in the preliminary round, but open/reuse plans must be explained. Upon entering the semi-final/final round, runnable code or equivalent verifiable engineering materials must be submitted, along with a repository or delivery package accessible to reviewers.
Deployment Instructions Requirement	Yes. From the semi-final round onward, the entry point, dependency installation, configuration methods, environment requirements, and reproducibility instructions must be provided.
Commercial API Usage Allowed	Allowed, but invocation details, cost assumptions, scope of authority, substitution feasibility, and potential vendor lock-in risks must be disclosed.
Closed-Source Model Usage Allowed	Allowed, but the scope of usage, reasons, alternatives, migration costs, and impact on reproducibility must be explained.
Continued Development Based on Existing Projects Allowed	Allowed, but the source of the original project, scope of team contributions, innovation points, and compatibility with the original license must be explained.
Item	Requirement Description

Data Sources & Authorization Requirements	When using personal, enterprise, financial, government, industrial, or third-party data, the sources, authorization status, anonymization methods, and compliance boundaries must be explained.
Third-Party Dependency Disclosure Requirements	Open-source dependencies, commercial services, tool interfaces, external system permissions, licenses, and key version details must be fully disclosed.
Other Restrictions	Entries that infringe on privacy, violate data authorization, replace professional institutions in high-risk decisions, or affect actual safety controls must not be submitted.

9.1 Data Compliance

- Entries must not use unauthorized data, personal sensitive information, trade secrets, non-public business data, or data sources that violate laws and regulations.
- If the entry involves user profiling, learning records, financial documents, vehicle information, industrial data, audio/video recordings, or environmental recognition, the data sources, processing methods, and privacy protection measures must be explained.

9.2 Intellectual Property Rights

- Entries must ensure that the submitted content, code, models, data, documents, assets, and presentation materials do not infringe on the intellectual property rights of others of any third party.
- If open-source projects, third-party models, utility libraries, datasets, or assets are used, the corresponding license requirements must be complied with and explained in the submission materials.

9.3 Industry Boundaries

- Financial entries must not replace the investment judgments, credit approvals, insurance payouts, risk control decisions, or legal compliance opinions of financial institutions.
- Educational entries must not replace teachers' pedagogical judgments, school evaluations, exam results, or professional educational services.
- Automotive entries must not affect vehicle safety control, must not replace autonomous driving decisions, and must not guide users to perform high-risk operations during driving.
- Industrial entries must not directly control real production equipment, and must not replace on-site safe production decisions or professional judgments.

- AI glasses entries should pay close attention to user privacy, audio/video recording authorization, environmental recognition boundaries, and personal data protection.

9.4 Risk Warnings and Violation Handling

- Entries should provide necessary prompts for uncertain results, high-risk recommendations, model hallucinations, missing data, interface exceptions, and business boundaries.
- The output of entries should, to the greatest extent possible, provide source bases, reference materials, confidence level explanations, or human confirmation mechanisms.
- If an entry involves data compliance violations, infringement, plagiarism, malicious attacks, false demonstrations, fabricated results, violation of platform rules, or other inappropriate behaviors, the Organizing Committee reserves the right to demand rectification, cancel scores, or disqualify the entry.
- The specific determination of violations, processing workflows, and appeal mechanisms shall be subject to the official rules of the competition.

10 Evaluation Criteria

10.1 General Evaluation Dimensions

Evaluation Dimension	Weight	Description
Industry Scenario Value	25%	Whether it addresses real, explicit, and representative industry problems; whether it can clearly explain target users, core pain points, actual demands, and value benefits; and whether it has potential for replication, migration, or promotion.
Agent Capabilities and Task Closed-Loop	25%	Whether it reflects task understanding, multi-turn interaction, plan generation, tool calling, knowledge enhancement, contextual memory, and result delivery, and whether it completes the entire process from user input to result validation.
Product Experience and Demo Completeness	20%	Whether interactions are natural, workflows are clear, and feedback is timely; whether the Demo is stable and runnable, allowing judges to understand and validate core values quickly.
Technical Implementation Depth	15%	Whether it reasonably utilizes capabilities such as large models, Agent frameworks, knowledge bases, tool calling, multimodality, and workflow systems, and whether the architecture is clear and the engineering materials are reproducible.

Safety, Compliance, and Traceability	10%	Whether it clarifies data sources, usage boundaries, risk warnings, and compliance constraints, and, when involving domains such as finance, education, industry, automotive, and personal terminals, explicitly states that it does not replace the final judgment of professional personnel, institutions, or competent authorities.
Open / Reusable Contribution	5%	Whether it produces reusable outputs, application templates, sample data, documentation, and open-source plans, and whether the license and third-party dependencies are clear.

10.2 Supplementary Topic-Specific Evaluation Criteria

- AI + Glasses: Focusing on glasses-nativeness, first-person perspective interaction, value of always-on wearing, and lightweight feedback experience.
- AI + Automotive: Focusing on the vehicle owner lifecycle understanding, closed-loop tasks, vehicle safety boundaries, and service chain adaptation.
- AI + Finance: Focusing on document understanding, source traceability, risk warnings, compliance awareness, and avoiding unauthorized decision-making.
- AI + Education: Focusing on education scenario authenticity, personalization capabilities, closed-loop tasks, pedagogical friendliness, and minors' / learning data compliance boundaries.
- AI + Industrial Manufacturing: Focusing on multi-source information fusion, closed-loop workflows, explainability, operability, and safe production boundaries.

11 Red Lines and Severe Deduction Items

- Submitting only concept descriptions, PPTs, or marketing materials without providing PoCs, experiments, simulations, logs, videos, platform scores, or equivalent verifiable materials will, in principle, lead to disqualification or severe point deductions.
- After the final lock, if the reviewing staff cannot reproduce the core Demo, experiments, or on-site tasks based on the README, deployment instructions, or track platform requirements, the qualification for awards may be revoked.
- If the final presentation is severely inconsistent with the semi-final commitments, is temporarily pieced together from non-team contributions, or fails to disclose existing project foundations, the results may be invalidated.

- Plagiarism, shell wrapping (re-skinning), fabricating experimental results, inflating community statistics, purchasing fake Stars/Forks/Issues/PRs, etc., once confirmed, will lead to the invalidation of results.
- Misrepresentation in disclosing data, Licenses, commercial APIs, closed-source models, personal information, enterprise data, hardware safety, or on-site control boundaries will lead to point deductions, disqualification, or legal actions depending on the severity.
- If contestants cheat during the competition, the Organizing Committee reserves the right, upon verification, to disqualify them and invalidate their results.
- Private code sharing between teams is not allowed. If sharing is indeed necessary, the teams must merge. If identical or heavily similar code is found, the Organizing Committee reserves the right to invalidate the results of the relevant teams.
- Entries must not infringe on third-party intellectual property rights, privacy rights, trade secrets, or data authorization boundaries.
- When involving high-risk scenarios such as finance, education, industrial safety, vehicle safety, or personal terminal privacy, the entries must not replace the final judgment of professional institutions, teachers, competent authorities, or on-site personnel.

12 Frequently Asked Questions (FAQ)

Q1: Is it mandatory to choose one of the five topics for the Boundless Agents track?

In principle, it is recommended that participating teams choose one direction from the five major topics. Teams may also propose more refined real-world scenarios within the scope of the topics. Still, they should align with the relevant industry direction and clarify their relevance to the topic.

Q2: Must the entries be open-source?

GOAI encourages open source, but does not mandate full open-source release of all entries. Upon entering the semi-final/final round, participating teams are required to provide reviewer-accessible code, engineering materials, Demos, evidence of operation, or equivalent verifiable materials as requested by the Organizing Committee.

Q3: Can commercial large models or closed-source models be used?

Yes. Unless otherwise specified in the topics, participating teams can choose open-source, commercial, platform, or self-developed models based on project needs.

Teams must clarify the model source, usage method, and key capabilities in their submission materials.

Q4: Can third-party Agent frameworks or development platforms be used?

Yes. Participating teams can use LangChain, LlamaIndex, AutoGen, Dify, Coze, ModelScope, Baibaoxiang, Lingzhu Platform, or other tool platforms. When using third-party platforms, teams should comply with the rules and authorization requirements of the corresponding platforms.

Q5: Must the entry use a specific technical framework or tool?

No. Participating teams can reasonably leverage capabilities such as large models, Agent frameworks, knowledge bases, tooling, workflow orchestration, multimodality, and memory management on real tasks. The evaluation focuses not on the stacking of technical jargon, but on whether the technology truly supports task-closed loops and user experience.

Q6: Can we submit only a video Demo?

Not recommended. A video Demo is one of the necessary materials. Still, participating teams should also submit materials such as the project introduction document, instructions for use, technical architecture descriptions, and data source and compliance statements. Upon entering the semi-final/final round, runnable or verifiable materials must also be provided.

Q7: Can simulated data be used?

Yes. For fields such as finance, education, automotive, and industry, if real-world data is inconvenient to disclose, teams can use public data, simulated data, sample data, or self-built datasets. When using simulated data, the simulation logic, field meanings, and applicability boundaries should be explained.

Q8: Can we connect to real-world business systems?

Yes, but data authorization, system safety, and compliance boundaries must be guaranteed. If enterprise internal systems, real user data, vehicle data, financial data, educational data, or industrial data are involved, the team must provide necessary explanations and bear the corresponding compliance liabilities.

Q9: Must the AI + Glasses topic use physical glasses?

Not necessarily. Participating teams can use Rokid Glasses or use simulators for development and demonstration. Specific hardware equipment, simulators, platform permissions, and usage methods shall be subject to notices from the Organizing Committee and partner units.

Q10: Can we develop projects related to autonomous driving for the AI + Automotive topic?

Developing entries for high-risk driving control or autonomous driving decisions is not recommended. This topic focuses more on application scenarios such as car owner services, intelligent cabins, vehicle purchase consultation, vehicle assistants, after-sales maintenance, and travel planning.

Q11: Can the AI + Finance topic be used for investment advice or loan approval?

Not recommended. Financial entries should be positioned as auxiliary analysis, document organization, workflow guidance, risk alerts, or information retrieval. They should not directly provide definitive investment advice, loan approval results, insurance payout conclusions, or replace financial institutions' decision-making.

Q12: Can the AI + Education topic directly give answers to students?

Not recommended. Educational entries are encouraged to help learners understand knowledge through prompts, follow-up questions, step-by-step explanations, error cause analysis, and similar exercises, rather than directly generating standard answers.

Q13: Can the AI + Industrial Manufacturing topic directly control equipment?

Not recommended. Industrial entries should be positioned as auxiliary analysis and recommendation systems, and should not directly control real industrial equipment or replace on-site safe production decisions.

Q14: Can a participating team submit multiple entries across different topics?

The specific rules shall be subject to the official notices on the competition website. If multiple submissions are allowed, the team must ensure that each entry includes a clear, independent scenario, a set of functions, and submission materials, and that no entry repackages the same project.

Q15: When will the resources, prize money, equipment, and platform capabilities be announced?

Relevant resources, prize money, equipment, platform capabilities, application methods, and usage rules will be announced in turn on the official website, official community, emails, or partner unit channels. The final details shall be subject to the Organizing Committee's official notices or announcements on the official website.

13 Q&A and Contact Information

13.1 Track Q&A Group

Please refer to the Q&A group QR code of the corresponding topic on the Track Details page of the official website.

The group will synchronize the latest information, including topic analysis, mentor Q&A, competition awards, resource applications, and submission requirements. Contestants are welcome to join the group to exchange and interact with mentors and other contestants.

13.2 Communication Channels for Overseas Contestants

If overseas contestants are unable to use WeChat groups, they can obtain competition notices, download materials, and receive Q&A support through the official email or international communication channels to be announced subsequently.

14 Final Notes

This handbook serves as a guide for the Boundless Agents track, helping participating teams understand topic directions, entry requirements, submission materials, and evaluation criteria.

Matters regarding schedule arrangements, registration rules, submission deadlines, evaluation mechanisms, resource support, awards and prize money, partner units, platform permissions, equipment distribution, shortlisting results, and award results shall all be subject to the official notices and website announcements of the GOAI World Artificial Intelligence Open Source Challenge Organizing Committee.

15 Appendix: Submission Templates

Appendix A: Proposed Structure for Project One-Pager

- Project Name
- Team Name and Member Information
- Selected Topic and Target Scenario
- Target Users and Core Problems
- Proposal Overview and Core Workflow
- Agent Architecture and Key Capabilities
- Data Sources, Tool Calling, and Technical Route
- Demo Execution Results

- Safety & Compliance Boundaries
- Open / Reusable Contribution
- Future Plans and Matchmaking Needs

Appendix B: Template for Agent Application Capability Checklist

Field	Description
Application Entry	Where users access the product, such as Web, mobile devices, glasses, in-vehicle infotainment systems, chat interfaces, or enterprise systems.
Target Users	Clarifying the service targets and their key tasks.
Core Workflow	Main steps from input to result delivery.
Agent Capabilities	Capabilities such as task understanding, plan generation, multi-turn interaction, tool calling, knowledge enhancement, memory, and result validation.
Tool / System Dependencies	Models, APIs, databases, knowledge bases, hardware, third-party platforms, or business systems.
Input & Output	Sample inputs, output structures, quality requirements, and presentation formats.
Failure Handling	Treatment of missing information, invocation failures, uncertain results, or high-risk actions.
Safety Boundaries	Explanations regarding privacy, data authorization, industry risks, human-in-the-loop confirmation, and not replacing professional judgments.
Runtime Evidence	Screenshots, videos, logs, evaluation metrics, user feedback, or test reports.

Appendix C: Demo Verification Checklist

Checklist Item	Completed	Description
Demo can be run from scratch	☐	Providing environments, dependencies, configurations, and startup methods.
At least one complete task chain	☐	Showcasing input, processing, tool calling, result delivery, and validation.

Clear explanation of sample data and permissions	☐	Specifying data sources, authorization, anonymization, and applicability boundaries.
Explainable failure and exception branches	☐	Specifying the handling of invocation failures, insufficient information, and high-risk judgments.
Traceable output results	☐	Providing source bases, logs, screenshots, or evaluation evidence.
Consistency between roadshow materials and Demo	☐	Mutual correspondence among the PPT, video, repository, documentation, and on-site presentation.

The schedule, resources, submission portals, and final interpretation shall be subject to the Organizing Committee's official website and subsequent notices.
